

Spatial Data Services

Knowledge is key to making informed decisions.

There are many advantages when you consolidate your seismic assets with Divestco. First, we can store your seismic survey information independently and securely in the industry-standard Oracle PPDM format. From there, you can easily access your data, integrate the data with other applications, and use the data for custom basemapping and other transactional activities. Divestco gives you an off-site, independent repository for your seismic assets, which is integrated with solid quality assurance processes that we designed to ensure consistency and data integrity. You will find that Divestco's database systems are reliable, easy to access, and cost effective.

The Database Administrator

When you work with Divestco, we assign a database administrator to personally work with your account. This ensures:

- One representative is familiar with your data, your business, and your account
- You have a direct line of communication and a representative for accountability
- Data is consistent and regularly updated because it is managed and maintained by the same person

On-line Access from your Office

When you choose to store your data with Divestco, you can have instant on-line access to our powerful in-house database, right from your own office! Use your in-house applications to access the database. For example: MapQ, OeX, DataStore, GeoWiz, Trango, PetroLab, and others. Whether you are building maps, retrieving attribute information, or performing simple queries, your data is at your command, all without the associated infrastructure required to support in-house databases.

Strategic Advantages of the Divestco Database System

- **Validates data integrity** - You have the option to integrate pre-qualified data through Geophysical Survey Audit quality assurance processes to ensure that all your data's integrity is validated prior to loading.
- **Increases data integrity** - We use the information stored in the database to further qualify the vertical and horizontal integrity of lines passing through Geophysical Survey Audit.
- **Gives fast data access** - Your client data is stored on-line for rapid retrieval and query. For example, to create custom reports, digital output, and maps.
- **Facilitates data transactions** - By storing your data in a central deposit, Divestco can assist your daily operations by providing transactional services that move your data to the processing house, partners, and other stakeholders.
- **Supports multiple formats** - We support both standard and custom digital exchange formats, which enable you to easily use the data with other applications.
- **Distributes to individual parties** - You can individually distribute specific data to authorized parties. For example, those resulting from partnerships, purchases, and other situations.
- **Supports new shoot planning** - You can take advantage of archived seismic lines which can be instrumental in planning new seismic programs. For example, matching up proposed 3D shooting with existing 3D coverage.
- **Gives you remote access to your data** - From your client site you can remotely access your data sets stored at Divestco. This enables you to query your database and pull information into applications without the in-house maintenance infrastructure.
- **Eliminates duplicate and erroneous data** - Our refined and proven automated scripts check your data for line and point data integrity, consistency, and process completion. This eliminates line duplication and the calculation of additional attributes.
- **Supports all line attributes** - We can extend the survey database to include all attributes associated with a seismic line and viewed through Divestco's DataStore application.
- **Centralizes for online management** - Creating and maintaining your central database has never been easier when you use DataStore. An online management tool that enables you to quickly and easily access and manage your data, right from your desktop.
